SUMMARY

Excels at migrating complex legacy systems to modern, cloud-native architectures, with a proven record in cybersecurity and healthcare. Uses AI coding tools to reshape and build daily engineering practices and agentic pipelines for code review and delivery, integrated directly into the product. Mentored teams to solve high-stakes challenges and delivered impactful, efficient solutions that improved technical sustainability.

SKILLS

Languages & Frameworks: Java, Spring Boot, Python, GO, JavaScript, Hibernate, JDBC
Distributed systems: Microservices, Kafka, RabbitMQ, SQL, Redis, event-driven architecture
Cloud & Infrastructure: AWS (EKS), Kubernetes, Docker, Rancher, Helm
Data & search: PostgreSQL, MySQL, OpenSearch, Elasticsearch
Security & engineering: RBAC, multi-tenant systems, system design, CI/CD, automated testing, deterministic engineering
AI Tooling: Claude Code, Codex, Copilot, JEV, DeepSeek, Gemini, Rovo
Leadership & Delivery: SDLC, FTE, Scrum, deterministic engineering, system design, people management, cross-functional delivery

EXPERIENCE

Staff Software Engineer, Contrast Security Jan 2021 – Aug 2026- Austin, TX

- Led the adoption of AI coding tools (Claude Code, GitHub Copilot, Gemini, Rovo) and designed agentic pipelines for testing and automated reviews using Claude Code.
- Engineered Spring Boot microservices for TeamServer and CVE Shield to process incoming vulnerability payloads, offloading static data and metadata to S3, thereby reducing main database load through Redis caching.
- Centralized vulnerability deduplication via Kafka messaging, eliminating redundant processing across downstream microservices.
- Maintained and upgraded core Java Spring applications including TeamServer, Agent Dashboard, OpenSearch Reporting, and Licensing Hub.
- Implemented a SaaS backend migration from MySQL to PostgreSQL with zero customer-facing downtime, improving reliability and query performance, and applied SQL tuning strategies to optimize performance.
- Designed a Kubernetes gateway API with fine-grained role-based access control (RBAC), enhancing access control across multi-tenant services.
- Migrated existing observable vulnerabilities from our SaaS into OpenSearch to produce aggregated executive summaries
- Using Claude to upgrade and modernize the licensing system to the latest Spring Boot
- Maintain and update the Contrast on-prem software delivery system as requirements change to keep it up to date.

Lead Software Engineer, DenimGroup Jul 2018 – Jan 2021 - *Austin, TX*

- Led the architectural transition from monolith to microservices, modernizing the stack to support enterprise-scale growth.
- Directed a mid-sized cross-functional team, establishing and implementing agile delivery practices that became organizational standards.
- Delivered Spring Kafka event streaming, Elasticsearch aggregation, and dynamic-search APIs on Kubernetes, the team's first production Kubernetes workload.
- Ran daily Scrum, grooming, and planning to manage the team workload.
- Planned monthly builds and set up CI/CD to help with existing SDLC.

Senior Software Engineer, SocialCare Jun 2015 – Jul 2018 - Austin, TX

- Designed and implemented the SocialCare v2 and v3 FHIR platform as a common REST API.

- Developed and implemented multiple packages for a critical client, including SC workflow, SC APM (Medical Action Plan Manager), and SC Survey.
- Converted and refactored SocialCare v1 framework to enable Java Spring implementation.
- Played a critical role in maintaining FHIR updates to keep the team on the latest FHIR data model.

Integration Engineer, Transverse Sep 2012 – Jun 2015 - Austin, TX

- Delivered a flexible pipeline environment where there were multiple disparate external systems that needed to integrate with Transverse Billing System.
- Successfully implemented a workflow system based on JBoss Fabric.
- Implemented a front-to-back UI to manage our workflow system based on input and output. The UI is a dynamic framework based on action types and the input/output of those actions.
- Responsible for maintaining and updating Transverse order system, which is a core component of the TRACT billing system.

Lead Developer, Halliburton Sep 2004 – Sep 2012 - Austin, TX

- Architectural lead for Landmark LSM, a global software delivery system. Integrated vendor APIs via SOA and built offline systems that interface with SAP, NetWeaver, and PeopleSoft.
- Lead Architect for Landmark Electronic Software Manager, a GWT MVC web client that enables secure global software delivery to clients on the Akamai network.
- Led development of Landmark Mobile checkout, a Java Swing application using a local XML datastore.
- Designed and implemented multiple systems and solutions, including the Halliburton Vendor Invoice system, Global IT Spending solution, and IT Alert system.
- Worked on the Offline Inventory application, which pushes and pulls data to and from SAP using Java NetWeaver.
- Led development of PeopleSoft Customer Relationship Management (CRM); built an integration layer between PeopleSoft, SAP, and Electronic Software Delivery.

Senior Consultant, Hitachi Consulting Apr 2004 – Sep 2004- Houston, TX

- Optimized efficiencies as Technical Lead for Champion COIN chemical analysis system.
- Coded and implemented Enterprise JavaBeans and the data access layer, business layer, and façade.
- Developed and launched main data entry screens which allowed field analysis of chemical samples.
- Set up the SAP portal, including security, content management, internationalization, and web services.
- Created a configurable framework, wrote ANT scripts, and designed test cases, test plans, and integration and acceptance testing.

Lead Senior Consultant, Sungard Consulting Jun 1999 – Apr 2004 - Houston, TX

- Spearheaded BP Energy Trading projects, including Deal Integration System (EIA) I, II, and III; ICE EConfirm System and Confirmation System; reconciliation system; and EIA-to-OTC deal integration.
- Maximized operations as Technical Lead for BP Deal Integration System (EIA) I, II, and III; designed and implemented a mapping engine that allowed flexible schema changes between internal targets and any external exchanges.
- Created adapter layers for all exchange trade systems, developed an XML object parser, implemented the TIBCO message specification, and enabled integration between BP's current EIA and Nucleus.
- Successfully completed multiple projects for Duke Energy Trading, Enform Technology, William Pipeline, and Equiva Trading Company.

Developer, Metasolv Oct 1996 – Jun 1999 - Dallas, TX

- Developed the OSS Gateway integration project; designed and coded the background processor.
- Created new database conversion script to allow data import using PL/SQL.
- Converted existing PowerBuilder code into Java services.

EDUCATION

BBA, Management Information Systems — Texas State University
